

**【Product Name】**

Thoracic Aortic Stent Graft System

**【Product Introduction】**

The product consists of a pre-assembled stent graft and a delivery system. The stent graft is available in two structures: one with a bare stent at the proximal end and one without. The bare stent is made of nickel-titanium alloy, and the stent and radiopaque markers are sewn onto a polyester covering using non-absorbable sutures. It is suitable for endovascular treatment of Stanford type B aortic dissection.
