

【Product Name】

Microcoil System

【Product Introduction】

The product usually consists of a coil and a delivery system. The principle of operation is to form a thrombus by filling the coil into the aneurysm through a minimally invasive approach, thus stagnating the blood flow within the aneurysm, thus reducing the pressure inside the aneurysm and preventing its rupture. It is clinically used for the filling of intracranial and peripheral vascular aneurysms, arteriovenous malformations and arteriovenous fistulas.
