

### **【Product Name】**

Rocuronium Bromide Injection

### **【Product Introduction】**

Rocuronium bromide injection, has all the pharmacological properties of this class of drugs (arrow-toxin-like action). It acts by competitive binding to N-type acetylcholine receptors at the motor endplate. Its effect is antagonised by acetylcholinesterase inhibitors such as neostigmine, edrophonium chloride and pyridostigmine. Rocuronium bromide injection is used as an adjunct to general anaesthesia for tracheal intubation during routine induction of anaesthesia and to maintaining skeletal muscle relaxation during surgery. Rocuronium bromide injection, like other muscle relaxants, should be administered in individualised doses.
