

**【Product Name】**

Artificial Heart

**【Product Introduction】**

The product is an assistive device that partially or completely replaces the natural heart to supply blood to the human body by using mechanical or biomechanical means. It is composed of four parts: a blood pump, a drive unit, a monitoring system, and an energy source. It can help patients with end-stage heart failure to restore their heart function, also be used to make the transition between heart failure patients awaiting heart transplantation, and even be used as permanent cardiac assistive means. It is suitable for end-stage heart failure patients .
